

## ABSTRACT

It is an object of the invention to provide a wire retainer capable of easily mounting a wire on a retainer part and of simply fixing the wire retainer to a circuit board. A lower part of a long cylindrical body forms a fixed part which is fixed to the hole defined in the circuit board by a solder, and a base part of a retainer member is fixed to a substantially central part of the long cylindrical body. The base part has an extension part extending upward therefrom and a restriction part is fixed to an upper end of the extension part and extends downward along an upper portion of the long cylindrical body. A lead wire is inserted between the restriction part and the upper portion and retained by the retainer member.
